

Press Release – Tuesday 7 December 2010

## BEdita 3.1 codename *Ulmus* released

We would proudly announce that today BEdita 3.1 (code name “*Ulmus*”) is being released officially.

BEdita is an object oriented development framework for web applications, that comes with a full featured Content Management System *out-of-the-box*. BEdita is released under the open source license Affero General Public License version 3 (AGPL3).

The project was started and is currently developed by ChannelWeb srl and Chia Lab srl, two Italian companies based in Bologna.

The release of BEdita 3.1 follows three years of hard work, efforts and research: this release introduces many improvements, regarding both User Interface and the underlying engine, and all known issues have been addressed. Noteworthy features amongst others:

- content **versioning**;
- **auto-save** mode of drafts;
- **concurrent access** to managed content is signalled and managed;
- new and improved **front end examples**, now featuring also the 2010 WordPress default theme “[Twenty Ten](#)”;
- support for **PostgreSQL** and SQLite;
- BEdita modules now exist as CakePHP **plug-ins**, managed in the Admin module (a "sample plugin module" is bundled).

BEdita 3 is released as an “Open Source” software and so it is freely available: visit [BEdita.com](#) and download the latest stable version or try the online demo.

If your project cannot undergo this licensing model, ChannelWeb and Chia Lab offer an alternative commercial license: contact us for details.

Explore and follow BEdita on:

- [www.bedita.com](#) - official main site
- [forum.bedita.com](#) - official discussion forum
- [api.bedita.com](#) - API and documentation
- [demo.bedita.com](#) - official demonstration websites
- [sourceforge.net/projects/bedita](#) - SF project (also on Freshmeat, Ohloh, Facebook, Twitter)

Regards,

Christiano Presutti
